My Website Project Plan

Objectives:

To describe step by step the processes of both building a computer from separately purchased components and the processes for removing and reinstalling a broken part.

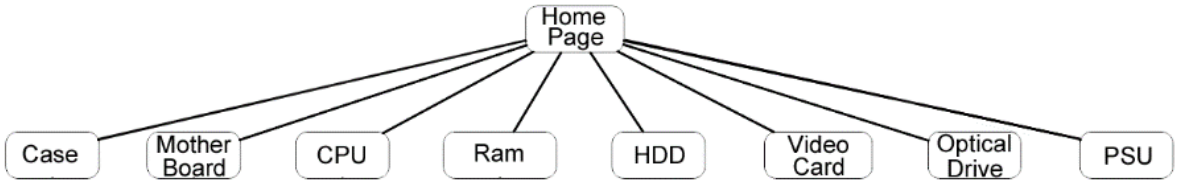
Target Audience:

Both people who are new to “do it yourself computer building” as well as people who are wanting to replace a damaged part in their computer without the need for paying a professional to do it.

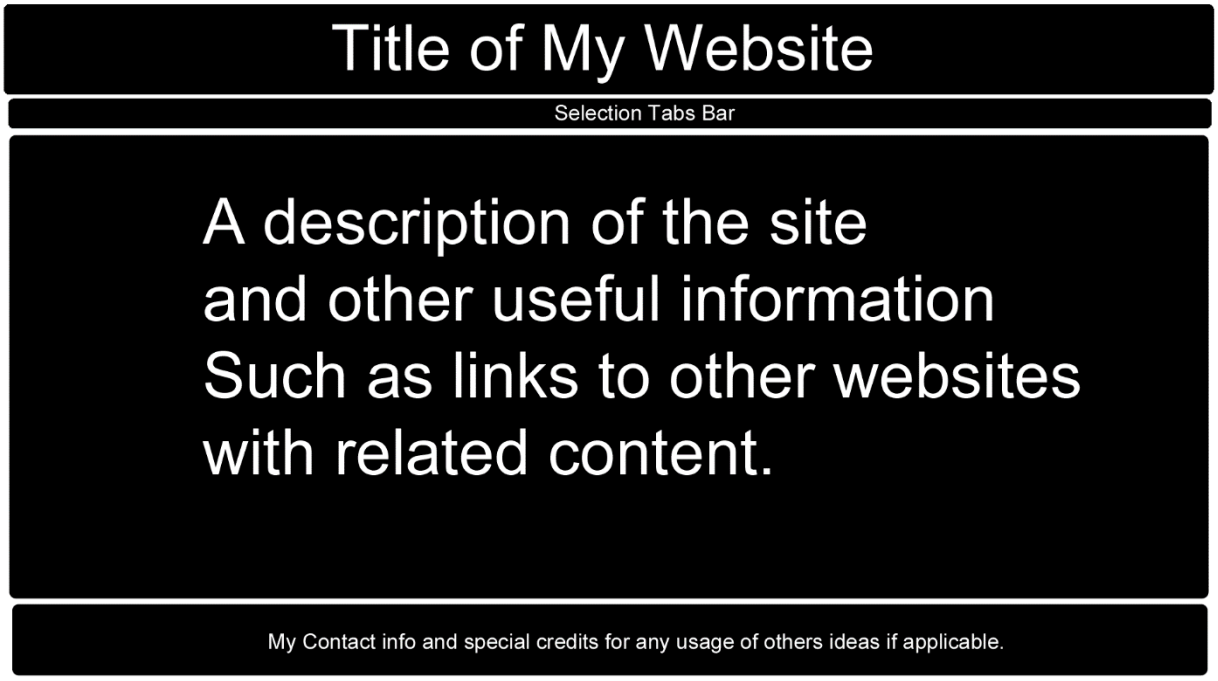
Site Type:

Informational.

Website Storyboard



Mark-Up/Website Layout



I am intending my site to be uniform on all pages and to be tab based so you click a tab on any page within the website and the title, banner, contact bar and style stays the same the only thing that changes is the content of the page and the tab you clicked in the tab bar becomes highlighted and possibly a section index down one side of the page or the other.

Sort of like this.

Where either the side section title bar follows you as you scroll down the page or it is stationary and the content is scrollable within the body section as an imbedded section.

Its nine pages but since the pages will be almost all the same layout and only the links for the tabs and the content will change it shouldn’t be too much more work I hope because I will be able to reuse snip-its of a lot of the code written from the home page and just alter things within it.
